Section A: Demographic Information

- Gender
- Age
- University Type
- Academic Level
- Department/Discipline

Section B: AI Usage

Measured students' frequency and purpose of generative AI usage in academic activities.

Variables:

- Regular use of generative AI tools for academic purposes
- Use of AI tools for assignment writing
- Use of AI tools for study planning
- Use of AI tools for research-related tasks
- Dependence on AI tools to complete academic work faster

Section C: Cognitive Dependence

Measured students' cognitive reliance on AI systems in academic environments.

Variables:

- Comfort level completing academic tasks without AI tools
- Reliance on AI before independent thinking
- Perception of AI as essential to academic workflow
- Use of AI for simple academic decisions
- Confidence level working without AI assistance

Section D: Trust in AI

Measured trust and confidence in AI-generated academic responses and recommendations.

Variables:

- Trust in AI-generated academic responses
- Perceived reliability of AI tools
- Verification behavior before using AI-generated responses
- Preference for AI suggestions over self-generated ideas
- Trust in AI recommendations for academic decision-making

Section E: Critical Thinking

Measured the influence of AI tools on analytical thinking and independent problem-solving abilities.

Variables:

- Reduction in deep thinking due to AI usage
- Reduced analytical effort when using AI-generated responses
- Preference for AI explanations over independent research
- Reduction in independent problem-solving efforts
- Dependence on AI-generated ideas over personal thinking

Section F: Academic Decision-Making

Measured the influence of AI tools on students' academic choices and performance-related decisions.

Variables:

- Influence of AI tools on academic decisions
- Use of AI suggestions for study-related decisions
- AI assistance in selecting research topics or project ideas
- AI recommendations for improving academic performance
- Positive influence of AI on academic decision-making processes

Response Scale

A five-point Likert scale was used for all behavioral variables:

1 = Strongly Disagree

2 = Disagree

3 = Neutral

4 = Agree

5 = Strongly Agree
